OSNOVI PROGRAMIRANJA VEŽBE 5

Marina Svičević, Đorđe Nedić, Mladen Marić, Danica Prodanović, Jovan Janićijević

 Napisati algoritam i program kojim se za uneti prirodan broj n (n ≥ 1) prvo štampa sve prirodne brojeve od 1 do n, pa onda sve parne brojeve od 1 do n i na kraju sve neparne brojeve od 1 do n.

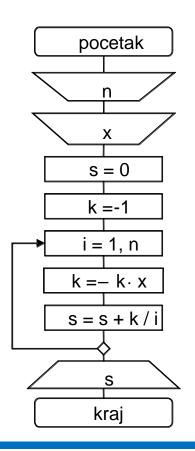

```
pocetak
     n
   i = 1, n
 = 1,n div 2
      2i
i = 1,(n+1) \text{ div } 2
    2i-1
    kraj
```

```
#include <stdio.h>
main()
{
         int i,n;
         scanf("%d", &n);
         printf("Svi brojevi od 1 do %d su : \n",n);
         for (i=1;i<=n;i++)
                  printf("%3d ",i);
         printf("\n Svi parni od 1 do %d su : \n",n);
         for (i=1; i \le n/2; i++)
                  printf("%3d ",2*i);
         printf("\n Svi neparni od 1 do %d su : \n",n);
         for (i=1; i \le (n+1)/2; i++)
                  printf("%3d ",2*i-1);
```

 Napisati algoritam i program kojim se za uneti prirodan broj n (n ≥ 1) i realan broj x,izračunava broj S na sledeći način:

 $S = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots + (-1)^{n-1} \frac{x^n}{n}$

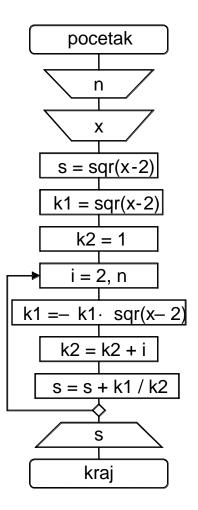

```
#include <stdio.h>
main()
         int i,n;
         float x,s,k;
         scanf("%d",&n);
         scanf("%f",&x);
         s = 0;
         k=-1;
         for(i=1;i<=n;i++)
                  k = -k*x;
                  s += k/i;
         printf("%10.6f\n",s);
```

 Napisati algoritam i program kojim se za uneti ceo broj n i broj x izračunava broj S na sledeći način:

$$S = \sum_{k=1}^{n} (-1)^{k-1} \frac{(x-2)^{2k}}{1+2+\cdots+k}$$

$$S = \sum_{k=1}^{n} (-1)^{k-1} \frac{(x-2)^{2k}}{1+2+\cdots+k}$$

```
#include <stdio.h>
#include <math.h>
main()
         int i,n;
         float x, s, k1, k2;
         scanf("%d",&n);
         scanf("%f",&x);
         s = pow(x-2, 2);
         k1 = pow(x-2, 2);
         k2 = 1;
         for (i=2; i<=n; i++)
                  k1 = -k1*pow(x-2,2);
                  k2=k2+i;
                  s += k1/k2;
         printf("%10.6f\n",s);
```

 Napisati algoritam i program kojim se za uneti ceo broj n i broj x izračunava broj S na sledeći način:

$$S = \sum_{k=1}^{n} \frac{\left(x-3\right)^{k}}{k^{n}}$$

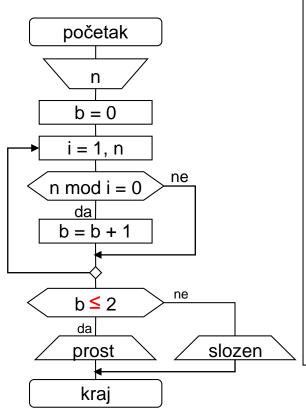

$$S = \sum_{k=1}^{n} \frac{\left(x-3\right)^{k}}{k^{n}}$$

```
#include <stdio.h>
#include <math.h>
main()
{
         int i,j,n;
         float x,s,k;
         long p;
         scanf("%d",&n);
         scanf("%f",&x);
         s = 0;
         k=1;
         for(i=1;i<=n;i++)
                  k = k*(x-3);
                  p=1;
                  // Moze i for(j=1;j<=n;j++) p=p*i;
                  for (j=0;j<n;j++) p *= i;
                  s += k/p;
         printf("%10.6f\n",s);
```

 Napisati algoritam i program kojim se za uneti ceo broj n ispituje da li je broj prost.

```
#include<stdio.h>
main()
         int n,i,b;
         scanf("%d",&n);
         b=0;
         for (i=1; i<=n; i++)
                  if (n \% i == 0) b++;
         if (b<=2) printf ("Broj je prost \n");
         else printf("Broj je slozen \n");
```

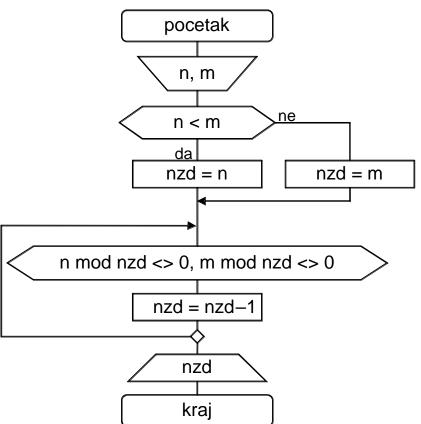

```
#include <stdio.h>
#include <math.h>
main()
         int n, i, ind;
         scanf("%d", &n);
         i=2;
         while ((i \le sqrt(n)) \&\& ind)
                  if (n \% i == 0) ind=0;
                  i+=1; // moze i i++;
         if (ind) printf("Broj je prost \n");
         else printf("Broj je slozen \n");
```

 Napisati algoritam i program koji za uneta dva prirodna broja m i n odredjuje njihov NZD.

```
#include <stdio.h>
main()
{
    int n,m,nzd;
    scanf("%d%d",&n,&m);
    if (n<m) nzd=n;
    else nzd=m;
    while((m % nzd !=0) || (n % nzd !=0)) nzd--;
    printf("%d\n",nzd);
}</pre>
```

```
#include <stdio.h>
main()
         int n,m,t;
         scanf("%d%d", &n, &m);
         do
                  if (n < m)
                            t=n;
                            n=m;
                           m=t;
                  if (n % m != 0) n = n-m;
         while (n % m != 0);
         printf("%d\n",m);
```
